Safety precautions

Always read this section before starting use.

Refer to Intro 71 for general precautions of the cylinder, and to Intro 78 for general precautions of the cylinder switch.

Guided cylinder STS/STL Series

Design & Selection

1. Common

CAUTION

- When using the metal bush bearing type with a long stroke and low speed, stick slipping may occur depending on load conditions. Use the ball bearing type in this case.

2. Position locking type STS/STL-^M_BQ

WARNING

- If pressure is supplied to port (A) in the locked state with neither port pressurized, locks may not be releasable or may be released suddenly, causing the piston rod to pop out, which is extremely dangerous. When releasing the locking mechanism, supply pressure to port (B) and check that no load is applied to the locking mechanism.

- If lowering speed is to be increased with the quick exhaust valve, the cylinder may move out faster than the lock pin and prevent the lock pin from being released correctly. Do not use a quick exhaust valve with the cylinder with position locking.

- Do not use a 3-position valve.

Do not use this cylinder combined with a 3-position valve, especially that with a closed center metal seal. This kind of use closes the pressure at the locking mechanism side, and is unable to lock the position. Even if locked once, air leakage from the valve may enter the cylinder then the lock may be released over time.

CAUTION

- Cylinder load factor must be 50% or less. If the load factor is high, the lock may not be released or the lock section could be damaged.
- If back pressure is applied to the locking mechanism, the lock may be released. Use the solenoid valve as a discrete unit, or use an independently exhausted manifold.
- Do not use multiple cylinders synchronized. Do not move 1 workpiece using more than 1 position locking type cylinder. One of the cylinder's locks may not be released.

3. Fine speed type (STS/STL-^M_BF)

CAUTION

- Use by oil-free. Features may change if the device is lubricated.
- Install a flow control valve close to a cylinder. Speed may be unstable if assembled away from the cylinder. Use the SC-M3/M5, SC3W, SCD-M3/M5, or SC3WU Series speed control valve.
- Generally, the speed is stable when the load factor is lower and when air pressure is higher. Keep the load factor at 50% or less.
- Do not apply lateral load on the cylinder. Install the cylinder to avoid the sliding guide to be twisted. The presence of load or resistance variation may result in unstable operations. Large differential between static friction and dynamic friction of guide results in unstable operation.
- Avoid use with vibration. The product will be adversely affected by vibration and operation will be unstable.
- Stable speed control is achieved with a meter-out circuit. When driving the single rod cylinder at fine speed with the operation direction set to PUSH, popping-out may occur if operation is started when load resistance is small. As a corrective action, use (b) and (c) or (d) circuit. Note that the (d) circuit is the most stable.

Guided cylinder
Combined functions

- Speed adjustment method of PUSH operation of circuit **d** :
1. Set the speed with the x flow control valve.
 2. Lower the flow rate with the y flow control valve until popping out no longer occurs.
 3. Reconfirm speed.

(Note 1) When circuits **b**, **c**, and **d** are compared, **d** circuit operation is most stable.

(Note 2) When installed vertically, the workpiece will drop naturally if the meter-in circuit is used. Use the meter-out circuit in this case.

(Note 3) Connect the speed control valve in the parallel with the following circuit.

- Reduce the flow rate to reach a fine speed at the exhaust side in a meter-out circuit. This results in the same pressure level on the both sides immediately after valve switched. The thrust caused by the differential of pressurized area of piston is applied to the PUSH direction and a popping-out of piston rod occurs.

(Guide to popping out occurrence)

- Popping out occurs when :
the piston rod area x air pressure > load resistance.

4. Coolant proof type STS/STL-M_BG₃

CAUTION

- Do not apply the deviated load onto the piston rod. It could shorten scraper and bearing life.

- If coolant or water do not get on the piston rod, select the G or G1 Series.

When using the G2 or G3 series and the coolant or water does not splatter, the piston rod's lubrication could be spent and cause the life to shorten.

- Install a flow control valve on the cylinder.

Install a flow control valve on the cylinder. Use within the working piston speed range of each cylinder.

5. Spatter adherence prevention type STS/STL-M_BG₄

CAUTION

- This cylinder series has improved durability over the general-purpose cylinder in atmospheres where spatter could occur. However durability may be shorter than the general cylinder when used in other environments.

Installation & Adjustment

1. Common

CAUTION

- Install a flow control valve when piping. The applicable joints are shown as below.

φ 80 cannot be piped on the side as shown above

- Check that no dents or scratches are made on main tubing installation or end plates that may adversely affect flatness.
Flatness on the counterpart onto which the end plate is installed must be 0.05 mm or less.

- When passing the bolt through the main body and installing, tighten with the following tightening torque.

φ 8, φ 12	1.0 N·m
φ 16	2.4 N·m
φ 20, φ 25	5.1 N·m
φ 32, φ 40	8.6 N·m
φ 50, φ 63	21.5 N·m
φ 80, φ 100	75.5 N·m

- Allowable energy

Use within the range at lower left of the curve. A separate shock absorber must be provided externally when used in the upper right range.

- The cylinder may malfunction if a magnetic substance, such as a steel plate, is nearby. Move the magnetic substance to at least 10 mm from the cylinder.
(Same for all bore size)

- The cylinder switch may malfunction if cylinders are installed adjacently. Separate cylinders by the following distances.
(Same for all bore size)

- The CKD shock absorber is treated as a consumable. Replace the shock absorber if the energy absorption performance starts to drop or if the movement is no longer smooth.

2. Position locking type STS/STL-M_BQ

⚠ CAUTION

- If the stopper is applied with an external stopper in the middle of the stroke, the lock may not function and result in dropping. Before setting the load, check that the locking mechanism functions correctly.
- Supply a pressure higher than the minimum working pressure to the port having the locking mechanism.
- If piping on the side with the lock is thin and long, or if the speed controller is separated from the cylinder port, exhaust may slow, taking time for the lock to function. This may also occur if the silencer on the valve's EXH, port is clogged.

3. Fine speed type STS/STL-M_BF

⚠ CAUTION

- Adjust the alignment, etc., so lateral load is not applied to the cylinder.
Adjust so that the cylinder does not twist in relation to the sliding guide.
The presence of load or resistance variation may result in unstable operations.
Large differential between static friction and dynamic friction of guide results in unstable operation.

During Use & Maintenance

1. Position locking type STS/STL-M_BQ

⚠ WARNING

- For safety purposes, prevent the load from dropping under its own weight during maintenance.
- When stopping with an external shock absorber, etc., adjust so that there is no bouncing. If the piston bounces, the sleeve and stopper position could contact with impact, and cause damage to the lock mechanism. Regularly (once/twice a year) check that the holding section is not damaged by this symptom.

⚠ CAUTION

- If the locking mechanism has been manually operated, check and then return it to the original position manually. Do not use a manual override except during adjustment, because this may be dangerous.
- Release the lock when installing or adjusting the cylinder.
The lock may be damaged if the cylinder is installed while the lock is applied.
- Use the flow control valve by a meter out.
Locks may not be released during meter-in control.
- Use the side with the lock with the cylinder stroke end.
The lock is not applied if the cylinder piston does not reach the stroke limit.

2. Coolant proof type STS/STL-M_BG₃

⚠ CAUTION

- Fluorine-based grease is used for G3 series. Note that lighting a cigarette with fluorine-based grease on hands generates toxic gases.

Rubber-air cushion mechanism

Explanation at PULL

The movement of piston until rubber air cushion and the cover contact, generates an air closed room in the area \blacksquare . The air in the shaded section is compressed as the piston moves, and energy is absorbed. Energy absorbed by the rubber air cushion's compression strain is also calculated at the stroke end.

Note 5
Note 6

Note on model no. selection

Note 1: Switches other than **E** switch model no. are also available. (Custom order)

Refer to Ending 1 for the details.

Note 2: Refer to pages 1526 to 1529 for available variation and option.

Note 3: Refer to pages 1526 or 1528 for dowel holes for positioning.

Note 4: $\phi 20$ and $\phi 25$ are copper and PTFE free as standard at ball bearing B.

Note 5: When the position locking mechanism is provided on the head end and 25st or less is selected, it may not be possible to insert the switch from the rod end. In this case, temporarily remove the end plate and mount.

Contact CKD for information on removing and assembling the end plate.

Note 6: T1H/V installation is the custom order.

For a 40mm more cylinder with 2 color indicator, preventive maintenance, strong magnetic field proof switches, insert "L1" with "-" between **A** and **B**.

Example) STS-MQ-L1-63-50-T2YH3-D-F
2 color indicator, preventive maintenance, strong magnetic field proof switches cannot be installed after purchasing a standard product. In this case, insert "L1" between **A** and **B** in model no.

Example) STS-MQ-L1-63-50-F

⚠ Note on model no. selection

Note 1: If a 25mm or less stroke is selected for valve side mounting, the valve mounting dimensions (VC) may be larger than the cylinder's total length (A + stroke). Check the dimensions with the dimension drawings.

Note 2: 2 indicator switch, preventive maintenance and strong magnetic field proof switches can not be installed on the front side of valve.

Note 3: Refer to pages 1526 to 1529 for available variation and options.

Note 4: Refer to page 1526 or 1528 for the dowel holes of positioning.

Note 4: T1H/V, T8H/V installation is custom order.

<Example of model number>

Model: Guided cylinder, short stroke length type with valve

A Bearing method : Metal bush bearing

B Operating direction : Extend at energized

C Valve installation attitude : Valve installed on the side

D Bore size : ϕ 20mm

E Port thread type : Rc thread

F Stroke length : 25mm

G Electric connection : Small terminal box, no lead wire

H Rated voltage : 100 VAC

I Switch model no. : Reed T0H, lead wire 1m

J Switch quantity : One on rod end

Combined functions

Check availability according to the selection guide. The selecting conditions are different from a general standard cylinder.

Step 2 Working conditions confirmation

1. Working pressure P (MPa)
2. Load W (N)
(load)

When determining the load, consider the weight of guide rod part of cylinder main body.

$W = (\text{load}) + (\text{jig load}) + (\text{guide rod part self-weight: a})$
Guide rod part self-weight formula is as on Table 1.

3. Installation attitude
(actuation)

Horizontal, vertical-up or vertical-down

4. Stroke length L (mm)
5. Operation time t (s)
6. Operation speed V (mm/s)

Formula of cylinder average operation speed Va

$$V_a = L/t \text{ (mm/s)}$$

Step 3 Rough cylinder size selection

- Formula of cylinder size (inner diameter)

$$F = \pi / 4 \times D^2 \times P$$

$$\therefore D = \sqrt{4F / \pi P}$$

D: Cylinder bore size (mm)

P: Working pressure (MPa)

F: Cylinder theoretical thrust (N)

- Calculating according to theoretical thrust value on Table 2.

The rough required thrust \geq load x 2

(x 2 of [load x 2] is a load as safety factor for load factor.)

(Example) Working pressure 0.5 (MPa)

Load 25 (N)

Required trust is 25(N) x 2 = 50(N)

Chose the proper bore size when used at 0.5MPa and theoretical thrust is more than 50N. Table 2 shows the answer that the bore size should be more than 12 mm.

$$D = \phi 12$$

 $M1 = F1 \times \ell 1 \text{ (N}\cdot\text{m)}$
 $M2 = F2 \times \ell 2 \text{ (N}\cdot\text{m)}$
 $M3 = F3 \times \ell 3 \text{ (N}\cdot\text{m)}$
- Refer to Fig. 2 for values of F1, F2 and F3.

* Refer to page 1648 for the allowable torque.

Step 6 Confirming cushion faculty

Check that cushion faculty of a cylinder can absorb the kinetic energy of actually used load.
 ● Allowable energy absorption (E1) of a cylinder is the specific value for each cylinder. For STS and STL Series, the value on Table 7 are used.
 ● Formula of kinetic energy (E2) of piston

$$E_2 = 1/2 \times W \times V^2 \times \frac{1}{10} \text{ (J)}$$

W: Load (N) Calculated value at Step 2

V: Piston rush into cushion speed (m/s)

$$V = L/t \times (1 + 1.5 \times \alpha / 100)$$

L: Stroke length (m)

T: Operation time (s)

α: Load factor (%)

Cylinder allowable energy absorption

● The value of kinetic energy absorbing faculty of cylinder cushion mechanism varies depending on cylinder bore size. For a guided cylinder, compare the values on Table 7.

Table 7 Allowable energy absorption of STS/STL (E1)

Safety precautions

- Note 1: When using as a stopper, select a model with the stroke length not greater than 50mm (STS-M). (30 mm stroke or less for φ 8 to φ 16)
- Note 2: The stopper section must be $l = 50$ mm long or less.
- Note 3: When fixing the cylinder main body, bolt screw depth should be $2d$ and over, and consider countermeasures for loose prevention (adhesive, spring washer etc.)
(φ 80, φ 100 indicates screw depth $1d$. d indicates screw O.D.)
- Note 4: STS-B (ball bearing) cannot be used as a stopper.

Note 1: When load is applied during operation, allowable lateral load should be calculated according to the following two formulas.
 (Corrosion proof type) catalog allowable lateral load x 0.6
 (Option variation other than above) catalog allowable lateral load x 0.9
 2: When designing, consider safety factor according to working conditions.
